DETAILED ACTION

Reasons For Allowance

1. The following is an examiner's statement of reasons for allowance: Claims 1-4, 7-19, 22-29 (Renumbering as 1-25 respectively) are allowed.

The present invention is directed to a method and apparatus for method and apparatus are disclosed for transmitting symbols in a multiple antenna communication system according to a frame structure, such that the symbols can be interpreted by a lower order receiver (i.e., a receiver having a fewer number of antennas than the transmitter). Each independent claim uniquely identifies the distinct claimed features.

Regarding independent claim 1(Previously Presented) A method for transmitting data in a multiple antenna communication system having N transmit antennas, said method comprising the step of: transmitting a legacy preamble and at least one additional long training symbol on each of said N transmit antennas, wherein said legacy preamble comprises at least one long training symbol, wherein a sequence of each of said long training symbols on each of said N transmit antennas are orthogonal, and wherein each of said long training symbols are time orthogonal by introducing a phase shift between at least two of said training symbols transmitted on one of said N transmit antennas.

Regarding independent claim 16 (Previously Presented) A transmitter in a multiple antenna communication system, comprising: a transmitter circuit; and N transmit antennas for transmitting a legacy preamble and at least one additional long training symbol on each of said N transmit antennas, wherein said legacy preamble

comprises at least one long training symbol, wherein each of said long training symbols are orthogonal, and wherein each of said long training symbols are time orthogonal by introducing a phase shift between at least two of said training symbols transmitted on one of said N transmit antennas.

Regarding independent claim 26 (Currently Amended) A method for receiving data on at least one receive antenna transmitted by a transmitter having N transmit antennas in a multiple antenna communication system, said method comprising the steps of: receiving a legacy preamble and at least one additional long training symbol on 5 each of said N transmit antennas, wherein said legacy preamble comprises at least one long training symbol and an indication of a duration of a transmission of said data, wherein a sequence of each of said long training symbols on each of said N transmit antennas are orthogonal, said legacy preamble transmitted such that said indication of a duration is capable of being interpreted by a lower order receiver, and wherein each of said long training symbols are time orthogonal due to a phase shift that was introduced between at least two of said training symbols transmitted on one of said N transmit antennas; and deferring for said indicated duration.

Regarding independent claim 29 (Currently Amended) A receiver in a multiple antenna communication system having at least one transmitter having N transmit antennas, comprising: a receiver circuit; and at least one receive antenna for receiving a legacy preamble and at least one additional long training symbol on each of said N transmit antennas, wherein said legacy preamble comprises at least one long training symbol and an indication of a duration of a transmission of said data, wherein a

sequence of each of said long training symbols on each of said N transmit antennas are orthogonal, said legacy preamble transmitted such that said indication of a duration is capable of being interpreted by a lower order receiver, and wherein each of said long training symbols are time orthogonal due to a phase shift that was introduced between at least two of said training symbols transmitted on one of said N transmit antennas; and means for deferring for said indicated duration.

The closest prior arts are silent with respect to the uniquely distinct claimed features: "wherein each of said long training symbols are time orthogonal due to a phase shift that was introduced between at least two of said training symbols transmitted on one of said N transmit antennas; and deferring for said indicated duration" as recited in **claims 1, 16**, "wherein each of said long training symbols are time orthogonal due to a phase shift that was introduced between at least two of said training symbols transmitted on one of said N transmit antennas; and deferring for said indicated duration" as recited in **claims 26, 29**.

Claims 1, 16, 26 and 29 are allowable since the closest prior arts either singularly or in combination fail to anticipate or render the uniquely distinct claimed features obvious.

Dependent claims 2-4, 7-15, 17-19, 22-25, 27-28 are allowed by virtue of their dependency on claims 1, 16 and 26.

2. Any comments considered necessary by applicant must be submitted no later than the payment of the issue fee and, to avoid processing delays, should preferably

accompany the issue fee. Such submissions should be clearly labeled "Comments on Statement of Reasons for Allowance."

Conclusion

3. The prior art made of record and not relied upon is considered pertinent to applicant's disclosure.
